

Gender-Differentiated Price Index and Inflation

Forecast for High Female- Consumption Products in Mexico

December 2, 2025

Arthur Beltrao

Project Purpose

ANALYTICAL SCOPE

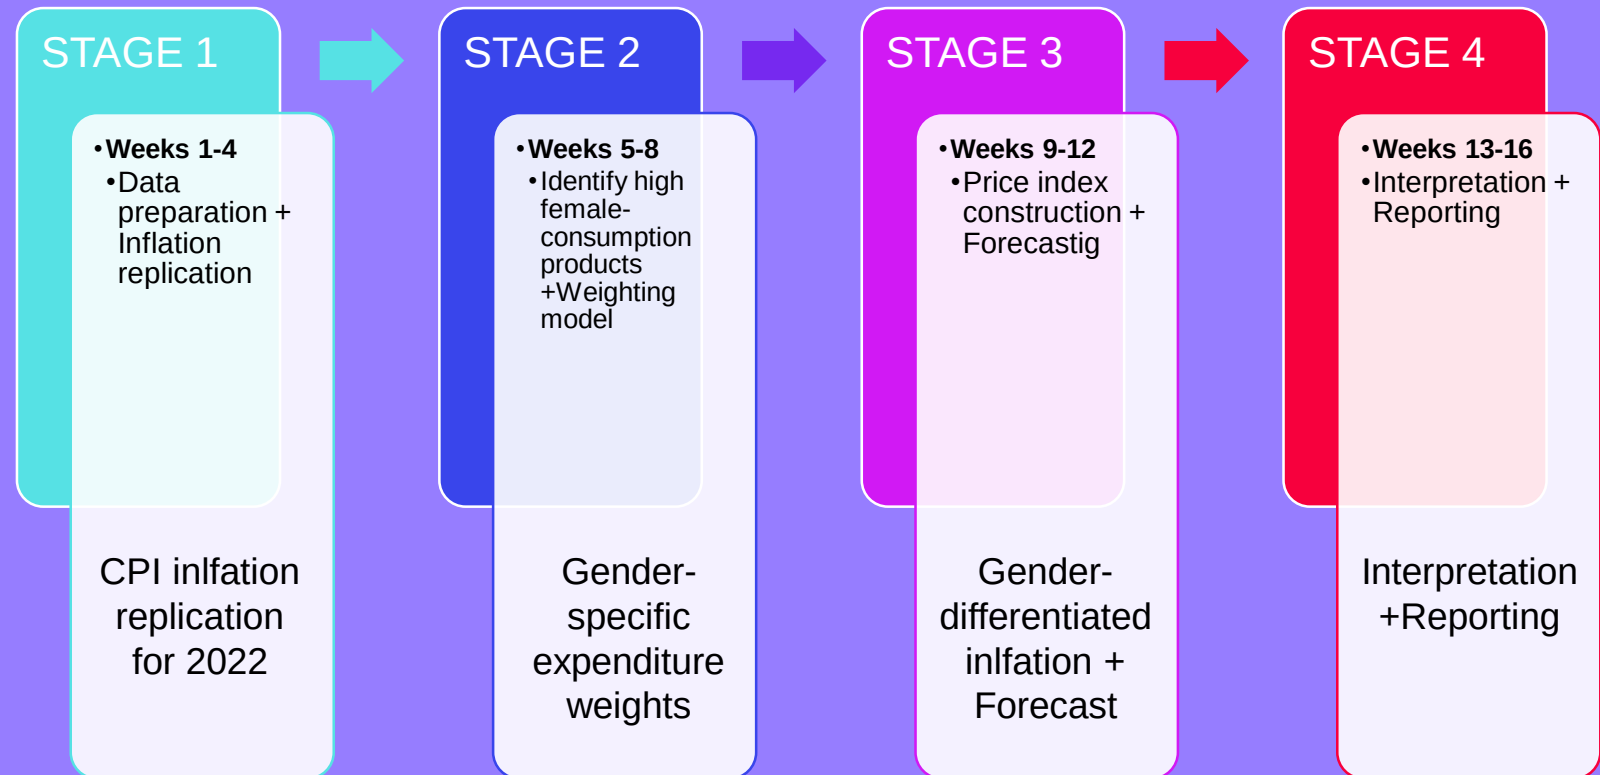

- ✓ The project aims to evaluate whether **inflation affects women differently than men** by constructing a **gender-differentiated price index** for Mexico.
- ✓ Consumption patterns will be analyzed using **ENIGH expenditure microdata**, distinguishing **female-headed** and **male-headed** households.
- ✓ Products with **high female-consumption intensity** (e.g., personal care, childcare, healthcare, education) will be identified and grouped for focused measurement.
- ✓ Price dynamics from the CPI (INPC in Spanish) will be combined with gender-specific expenditure weights to compute a **gender-sensitive inflation series**.
- ✓ The study will also produce a **forecast for female-consumption product inflation**, generating insights relevant to **economic vulnerability and public policy**.

GOALS SET WITH THE MENTOR (16-WEEK PROGRAMME)

- Identify and classify **high female-consumption products** using ENIGH.
- Compute **gender-specific expenditure weights** for consumption baskets.
- Replicate **2022 inflation behaviour** of those product groups using INPC.
- Train forecasting models to predict **future inflation pressures**.
- Deliver a **complete analytical report and presentation** summarising findings.

G-CPI FORECAST FOR HIGH FEMALE- CONSUMPTION PRODUCTS IN MEXICO

TIMELINE

MILESTONES COMPLETED

- ❖ **Python/Jupyter workflow** established for **CPI replication and inflation forecasting**.
- ❖ **ENIGH methodology clarified** for CPI weighting:
 - **Traditional ENIGH (biennial)** historically used for CPI weights.
 - **Seasonal ENIGH 2022** incorporated in the latest CPI update to better capture **year-round consumption**.
- ❖ **Analysis conducted** to determine the **most appropriate series** to work with.
- ❖ **Key household and expenditure variables evaluated** for **G-CPI construction**.
- ❖ **Changes in CPI methodology** over time were reviewed.
- ❖ **Differences between Traditional and Seasonal ENIGH datasets** analyzed to guide **variable selection**.
- ❖ **Methodological roadmap** established for **G-CPI development**.

National Survey of Household Income and Expenditures (ENIGH)

Survey
Traditional ENIGH 2022

Households surveyed
105,525 households

Seasonal ENIGH 2022
(ENIGH Estacional)

50,968 households

Dimension	Traditional ENIGH	Seasonal ENIGH (12-Month Survey)
Frequency	Conducted every two years	Conducted continuously throughout the year
Time Coverage	Single survey period used to infer annual spending	Direct observation of household spending across all seasons
Consumption Representation	Captures annual household expenditure	Captures annual expenditure plus seasonal peaks (school season, holidays, summer, etc.)
Use in CPI/INPC	Historically used for CPI weighting until the 2018 base	Adopted for the 2024 CPI update due to improved capture of real consumption patterns
Main Strength	High comparability and continuity over time	Higher accuracy and sensitivity to real consumption behavior
Main Limitation	May underestimate categories with strong seasonal variation	Requires more complex modelling and processing

- Encuesta Nacional de los Hogares (ENH)
- Encuesta Nacional de Ocupación y Empleo (ENOE) población de 15 años y más de edad
- Encuesta Nacional sobre Confianza del Consumidor (ENCO)
- Encuesta Nacional sobre Uso del Tiempo (ENUT)
- Especiales
- Módulos
- Registros Administrativos y Estadísticas
- Características sociodemográficas en áreas pequeñas
- Históricas

Key Contribution of the Project

Technical Contribution

- Develops a **gender-differentiated measure of inflation**
- Based on **real expenditure evidence**, not assumptions

Social & Policy Contribution

- Reveals whether **inflation disproportionately affects women**
- Supports:
 - **Gender-aware poverty and vulnerability analysis**
 - **More precise targeting of social programmes**
 - **Improved policy design around cost of living**

¡GRACIAS!
